

Portal Demo User Guide

A visual walk-through for a layman or non-technical reviewer to understand how to use the portal step by step.

Main user journey

Who can use this guide

This PDF is suitable for the student, teacher, supervisor, or any layman who wants to understand the portal by looking at the process visually rather than reading the full technical documentation.

Step 1 — Login and Open Dashboard

The first step is only to sign in and confirm the dashboard loads correctly.

What to do

- Enter the demo username and password.
- Click Sign In.
- Confirm the dashboard opens and summary cards appear.

What to look for

- Total complaints
- Open / In Progress / Closed view
- Critical alerts
- Quick navigation buttons

Layman interpretation

If the dashboard opens after login and you can see complaint summaries and alerts, then the portal is working at a basic level.

Step 2 — Launch a Complaint

This is the most important daily-use flow in the portal.

Why this step matters

The site profile reduces errors by ensuring the complaint is linked with the correct media and bandwidth. After saving, the complaint becomes visible in dashboards, reports, and the site map.

Step 3 — Use Map, Directory, and Inventory

These pages help identify where the issue is happening and what equipment or media the site has.

Site Directory

- View DAUs, sections, MRV, and project sites.
- Check primary and secondary media.
- Check bandwidth profile.

Balochistan Map

- See configured sites visually.
- Hover or click markers to review complaint counts.
- Use type filter for DAU, section, MRV, and project site.

Inventory

- Check firewall, switch, LAN IP, media IPs, and serial numbers.
- Use this page for on-spot field reference.

Layman interpretation

These three pages answer three different questions: Where is the site? What media does the site have? What hardware and IP information is available for the site?

Step 4 — Use AD Support and Technical Tasks

The portal also records non-network support work that still belongs to the same operational workflow.

AD Support

Log password reset, account unlock, and OU transfer requests. Use the charts to identify repeated support burdens.

Technical Tasks

Log installation, upgradation, replacement, repair, and preventive maintenance work for sections, field sites, or MRV.

Why these pages matter

They show that the portal is not only for telecom complaints. It also tracks user support and on-ground technical work, which makes the project more complete and more useful in real operations.

Step 5 — Generate Reports and Finish

The final stage is using the report section and closing the working cycle.

Simple final message

If a user can log in, launch a complaint, view the map, check the inventory, record AD or technical work, and generate a report, then the portal is functioning as a complete end-to-end system.
