

Project Notes Visual Guide

A redesigned visual guide to explain the portal structure, modules, roles, reporting logic, and site/media relationships in a more presentation-friendly way.

What the portal covers

- Complaint intake, closure, and telecom escalation
- Balochistan map with site-level complaint visibility
- Site directory with primary/secondary media and bandwidth
- AD support, technical task tracking, inventory, and reporting

Main operational pages

- Dashboard
- Complaint Desk
- Reports
- Balochistan Map
- Site Directory
- Inventory
- Technical Tasks
- AD Support
- User Management

Why this matters for viva/report

This project is no longer just a complaint form. It now demonstrates operational tracking, role-based access, technical support workflows, site/media management, and management-level visibility for higher authorities.

Best explanation in one line

The portal is a regional operations control desk for NADRA RHO Quetta Region where complaints, AD requests, technical jobs, inventory, site media, and reporting are managed from one place.

Portal Architecture Overview

This page shows how the operational modules depend on each other so the examiner can understand the complete system quickly.

Role-Based Access Model

This page explains who can use which part of the portal.

Admin

- Full access to all modules
- Can create/update/delete users
- Can create/update/delete site directory records
- Can manage inventory records
- Can reset or reload sample data

Network Engineer

- Can launch complaints
- Can manage inventory
- Can manage technical tasks
- Can use reports and AI assistant
- Cannot manage user accounts

Network Technician

- Can view inventory
- Can work on complaint desk
- Can use map and technical task pages
- No admin user control

Practical authority logic

This role model reflects a realistic office environment: admin manages the system, the network engineer handles operational oversight and reporting, and the technician supports field and device-side tasks. This makes the project more complete and credible.

Data Quality and Error Reduction

This page visually explains how the portal reduces mistakes during complaint launch.

Fields now linked through the site profile

1. Site Directory stores primary media and secondary media.
2. Complaint Desk reads the site profile and narrows provider selection.
3. Reports show the configured media profile for management visibility.
4. Inventory reuses the same media profile and lets you add IP-level detail.
5. Map shows the configured sites and lets you inspect site complaint counts quickly.

Reporting Design for Higher Authorities

This page summarizes how the reporting section can be presented to supervisors and decision-makers.

Complaint Reporting

- Status comparisons
- Provider comparisons
- Issue comparisons
- Monthly trends
- Critical alerts
- Map-based complaint visibility

Support / Asset Reporting

- AD support counts
- Repeated reset/unlock employee alerts
- Technical task origin comparison
- Technical task type comparison
- Inventory media distribution
- Inventory snapshot table

Reporting conclusion

The design makes the portal suitable for routine operations and monthly review. Supervisors can quickly identify open critical complaints, repeated support burdens, media distribution, and site-level concerns without reading every record manually.

Deployment and Submission View

This page is formatted as a final quick reference for the student.

Best final checklist

- ✓ Repo is public and opens in incognito mode.
- ✓ Live deployment works and login screen appears.
- ✓ Complaint launch, reports, map, AD support, inventory, and technical tasks all work.
- ✓ README contains correct live URL, GitHub link, screenshots, AI prompt, and setup steps.
- ✓ No API keys or secrets are committed into the repository.
